What is WordPress?

WordPress is a web content management system. It was originally created as a tool to publish blogs but has evolved to support publishing other web content, including more traditional websites, mailing lists and Internet forum, media galleries, membership sites, learning management systems and online stores. Today, over 60% of the websites worldwide are running on WordPress. For more information visit www.wordpress.org (open source) or www.wordpress.com (hosted) today.

PasswordFree

When a site owner of a business creates their website on the **WordPress** platform, they are offered a number of options and plug-ins to integrate into their website to make it stand out from a list of similar websites. **PasswordFree™ Customer MFA** provides a delightful customer experience during registration and authentication, and it protects your online customers and users with patented phishing-resistant technology.

Our **PasswordFree™** plugin, available in the **WordPress Plugin Directory**, allows for one-click, no-code integration to your website. Freeing your customers and users from the burden of passwords will boost up your business with minimal efforts on your side. Without passwords to waste time on, your customers and users have more time to explore what your website has to offer.

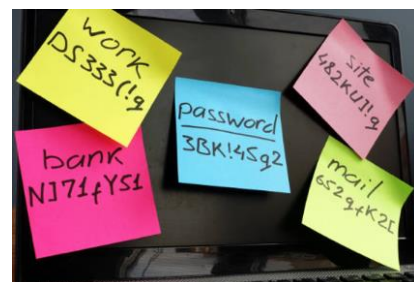

The burden of passwords and SMS OTP

Passwords have recently become a business inhibitor for online websites, with 1/3 of all shopping carts being abandoned due to forgotten passwords. Making matters worse with SMS OTP sending 6-8 numbers to an email address or cell phone adds to the user frustration. For what it's worth, passwords and SMS OTP provide very little security because impersonated websites can simply ask the user for those things. Online visitors need a simple and secure way to register and return to your website.

Now, the customers visiting your webstore can use just these three factors to register and/or authenticate online:

- Something they know which is their login.
- Something they have which is their smartphone turned into a trusted security token.

Something they are which is biometrics (fingerprints or face scans).

Online visitors will register and keep returning if the experience is easy and engaging. Identity offers a **PasswordFree™ MFA** solution powered by the **PasswordFree™** (short for “no passwords”) technology that can be added to your website in one click.

What is PasswordFree™?

PasswordFree™
 ☆☆☆☆☆ (0)

Passwordfree™ is an essential customer biometric MFA for fast, easy, and more secure login experiences. No coding, Boosts sales, Free app.

By Identité

Fewer than 10 active installations Tested with 6.5.2
